PROPOSAL DESCRIPTION (10 pts)

Motivation (1 pt)

We got motivated for this project because We have been that shy guy or girl who has seen many other people being confused about the same topic that We was also unclear about. We noticed that it is actually common in class. Sometimes we all have the same doubt, but nobody wants to ask the teacher again.

When We asked my friends, “Let’s ask sir to explain it again,” they were like, “Nah, who is going to ask? We are shy and we can’t just go and ask. He might not explain it again.”

So We thought there should be some way where students can tell the teacher what they didn’t understand without feeling shy or uncomfortable. That is where the idea of ClassVoice came from. Students can give short and anonymous feedback after a lecture, and the teacher can see which topics many students are struggling with.

State of the Art / Current solution (1 pt)

At present, the students have the possibility of giving feedback by means of discussions in class, Google Forms, surveys, Learning Management Systems, or communication with a teacher. These ways are effective, yet they do not make it apparent what exact issues districts confuse students most.

Moreover, many learners tend to refrain from offering the sincere evaluation of their learning process because of the fact that they can be identified. They might think that their issue is trivial or they will awkwardly see it.

ClassVoice wants to resolve this question by ensuring anonymity of the feedback provided by students. Thus, a student is able to give a short comment on the subject he/she has difficulties with. Hence, the information provided by the students can be categorized by means of which it becomes visible for a teacher what issues are mentioned by large number of students and thus need further explanations.

Project Goals and Milestones (2 pts)

Project Objectives

1. To create the ClassVoice project in the form of a Java-based web application that can collect anonymous feedback from students.
2. To offer specific modules for both the student and teacher with the necessary logins, being organized according to their roles.
3. To allow students the opportunity to choose a specific lesson and provide anonymous feedback for that lesson.
4. To store the feedback in the MySQL database without linking it to the student directly.
5. To implement a Java-based content management system using keywords to detect the issues in learning.

Milestones of the Project

1. **Analysis of Requirements** – Evaluate the requirements of teachers as well as students and finalize the features of the system.
2. **Design of System and Database** – Create the design of MVC architecture, structure of database, user roles, and principal modules of system.
3. **Development of Student Module** – The follow-up is to develop the process of registration/logging in for students, management of sessions, choice of lectures and submission of feedbacks.
4. **Development of Teacher Module** – The following steps would include the development of logging in for teachers, management of lectures, and creation of teachers’ dashboard.
5. **Integration with Database** – This phase entails the connection of application with MySQL by the usage of JDBC and performing certain operations related to the database.
6. **Anonymous Feedback System** – A system for anonymous feedbacks must be developed to prevent the scrutiny of the identity of the student supply feedback.

Project Approach (3 pts)

The project is to be developed using Java and the MVC approach.

The front end will involve the use of HTML, CSS, and JSP, while Java Servlets will be responsible for requests and application control. The core logic will be incorporated in Java classes whereas JDBC will serve as a link to the MySQL database.

The project will have two major user categories – Student and Teacher.

As far as students are concerned, they will log in, choose a selected lecture, and give feedback in a single sentence.

This feedback will be stored without ID of the student.

Teachers will manage lectures, view the feedback of students and have the Java tool that will analyze feedback based on keywords in it.

For instance, feedback such as "I am not aware of normalization", "I am confused about 2NF" and "I am not aware of 3NF" will be categorized into normalization topic.

Then, the overall count of responses will be calculated and shown to the teacher.

The project is to apply DAO classes for the database operations along with sessions/filters for the authentication and role access.

System Architecture (High Level Diagram)(2 pts)

Project Outcome / Deliverables (1 pts)

Project outcome

At the end of this project, we will have a ClassVoice Java web application that allows students to give feedback on the lectures anonymously.

The system will allow teachers to see the feedback anonymously, and identify the subject matter of what topics are creating difficulties for their students. The similar feedback will be categorized based on topic detection through the keywords, and the system will show the frequency and number of each common topic.

Deliverables

- * Working Java web application
- * Student login and page
- * Teacher login and page
- * Lecture and subject management
- * Anonymous feedback creation
- * MySQL database and database structure
- * JDBC and DAO implementation
- * Java-based topic detection
- * Feedback categorizing
- * Teacher dashboard

Assumptions

1. Both students and teachers will have an access to a web browser as well as an internet connection or a local area connection.
2. Students will provide truthful and relevant feedback concerning any lectures.
3. Feedback will be limited to short text and one-word responses.
4. The system will be developed using Java language, JSP, Servlets, JDBC, MySQL and Apache Tomcat.
5. The keyword-based topic detection will operate on the basis of pre-defined topics and keywords.
6. The system is especially developed as a college project and a prototype.
7. Teachers will assist in indicating the problems experienced by students and in explaining the topics if necessary.
